

# BUSINESS SECURITY REVIEW

## Why Your Business Needs a Security Review

Based on recent studies, your business is probably at high risk for a security breach. At the same time, you may not be able to afford the in house personnel necessary to understand and negate your risks. This is a competitive disadvantage. Even if you use an IT company, they often do not have the security expertise, or are focused on the particular products they sell, not the ones you necessarily need. **Our service is designed to give you a quick overview of your security exposure, and to help you know where to start in closing vulnerabilities.**

### Our process is simple

- We sign a mutual non-disclosure agreement, ensuring that any information we obtain will not be shared.
- We send you a short, easy questionnaire.
- We schedule a site visit, which will not take more than an hour. We will tell you in advance what we need to see, and who we need to speak to during our visit.
- Shortly after our visit, we will send you a completed scorecard, along with specific recommendations for remediation.

If you have an IT company or in house staff, they will most likely be able to implement the recommendations. If not, we will be happy to assist you in getting the work done. To ensure the safety of your information, **you will NOT be asked for passwords**, and you will observe anything we do in reviewing your systems. We can guarantee that you will be satisfied with our work, or you owe nothing!

Its that simple to have piece of mind!

### IS YOUR BUSINESS AT RISK?

Are you the next Anthem or Sony? They have deep pockets, allowing them to bounce back. Do you? If your answer is no, you need to do everything possible to make sure your network is secured against intrusions.

It only takes a small lapse in security to make your network vulnerable to successful attack. The recent Sony attack began simply with stolen credentials from an administrative account. It's that easy to be vulnerable. All it takes is:

- A smartphone with malware
- An employee clicking on a seemingly innocent link in an email
- A lost or stolen laptop

What you need is peace of mind, and we can help to provide that, by performing a review of your network and physical security, and giving you a detailed analysis using our proprietary scorecard.

Call us today, and sleep better tonight!

### togoCIO's Security Scorecard

Our proprietary scorecard has been developed over many years, and incorporates the major requirements of common compliance standards, including HIPAA, PCI, and SOX. It has successfully withstood numerous audits by enterprise audit departments, CPA firms, and federal agencies. It includes:

#### BASIC PENETRATION TESTING

We look at your network from the outside, identifying major vulnerabilities that can expose you to attack.

#### PATCH REVIEW

One of the most serious potential risks is lack of software patching. Cisco reported that in 2014, only 10% of Internet Explorer activity involved a patched browser. We review your patch procedures, and spot-check patch levels.

#### WIRELESS (Wi-Fi) SECURITY

Your employees are not the only ones who can see your wireless network, and if it is not properly secured, you are inviting the world in. We review your wireless security settings for known vulnerabilities and exposures, and check for rogue networks.

#### PHYSICAL SECURITY

Physical security is often overlooked, but can expose your business not only to network security issues, but can impact the safety of your employee. We will review your physical security against industry best practices.
